Comments:

Mr. Melonas, I want to discourage the massive intervention in the Santa Fe National Forest above Santa Fe. Having seen both groomed and wild areas I thoroughly believe the less we humans do the more resilient the forest can remain.

The areas we groom, cut and burn will become more, not less susceptible to future erosion and fire. Each human ignited fire worsens the forest and the local air quality. The "Total Impact" of each planned action needs more review before we try to manage nature. We are likely to produce more problems with aggressive management that would be avoided by decreasing human presence and protecting the Wild forest areas.
